Why Tricentis Test Automation for Salesforce?

Testing with Salesforce practitioners in mind.

With Test Automation for Salesforce, professionals have a true end-to-end testing solution that is optimized for Salesforce pros that work in highly customized environments.

Quickly create test cases.

Fast, flexible authoring allows users of all skill levels to quickly configure and customize stable tests (including API steps to extend scenarios beyond the Salesforce app).

Be proactive in addressing bugs.

Create and then schedule tests that will alert you to when key Salesforce processes fail – before users or customers are negatively impacted.

Deploy with confidence at speed.

Because you thoroughly tested your new deployments with the help of automated testing, you'll greatly reduce production issues when you launch new features and functions.

Top Features

- **DevOps ready.** Test Automation for Salesforce supports in-sprint automation using a no-code/low-code approach, along with version control, branching, and merging – even syncing branches with platforms like GitHub.
- **Context aware to your unique Salesforce environment.** Other testing tools use generic terms to create test cases, which can be confusing and onerous. With Test Automation for Salesforce, you can access all standard and custom records and fields to expedite test case authoring.
- **Optimized for Salesforce Lightning.** Salesforce Lightning uses dynamic elements that continually change. This makes test case creation difficult and time-consuming in scripted test automation tools like Selenium. We solve this problem by automatically handling Salesforce Lightning components and locking in dynamic elements to future-proof your test cases.
- **No-code test case authoring.** Test Automation for Salesforce automates your Salesforce environment through customized pre-built steps, or using the no-code recorder, to make test case creation easy for developers, admins, and business testers – regardless of skill level.
- **Intuitive reporting and test management.** Easy-to-read dashboards allow you to quickly review test results and locate problems with the flexibility to schedule tests on the cadence you need.

What sets Tricentis Test Automation for Salesforce apart?

- **Free your team from spreadsheets:** Poor resource allocation, reactive, and labor intensive.
- **Open source frameworks:** High maintenance and not optimized for Web apps like Salesforce.
- **Generic web testing tools:** Slow test case creation and lacks context-aware features.

Deliver business value:

- **Reduce errors with production releases.** Deploy with confidence because you thoroughly tested new releases and configurations.
- **Automate and manage test cases.** Create test cases once and then know that with every subsequent release, your test cases will still work. This allows teams to be more proactive and quicker to address problems.
- **Resource maximization.** By testing faster and with more coverage, managers and executives can redeploy people and/or budget to expanding the footprint or to new projects.
- **Stay current with Salesforce releases and upgrades.** Don't fret over the next release. This tool is your secret weapon to help you gain the time advantage to ensure that releases and upgrades are ready for production.

Who should care and why?

Role	Jobs to do	How we can help
Salesforce administrator	Maintenance, user management, release preparedness, workflows, and the contact when system fails	·Testing of releases and profiles ·Easy test case development and management – no code or scripts ·Ensure Salesforce works ·Free up time
Salesforce developer	Build custom applications and solutions to dramatically improve Salesforce effectiveness	·Eliminate manual testing processes ·Automate unit testing ·Speed up DevOps ·Free up time
Salesforce tester, business tester	Functional, unit, regression, and end-to-end Salesforce testing	·Easy test case authoring and management ·Do not need to write scripts ·Ensure Salesforce works across the IT ecosystem ·Free up time – end manual testing
Salesforce owner (e.g., CIO, VP of Sales, VP of Marketing)	Show ROI for technology investment and innovate for internal user and customer needs	·Improved cadence of innovation delivery ·Get more innovation productivity from dedicated resources ·Enhanced user and customer experiences

Commonly asked questions

“Is there an additional Salesforce license cost when using Test Automation for Salesforce?”

There is no additional Salesforce license cost.

“Do I need to buy additional licenses when I add more users?”

No. Everyone in your organization can write and run tests. There is no limit on the number of users you can have on Test Automation for Salesforce. Instead, you pay for the number of test runs.

“What is the yearly test run limit?”

Your contract will specify the maximum number of test runs that can be executed in the cloud in a 12-month period. Unused test runs do not carry over to the next 12 months.

“It’s really easy to use, especially compared to other solutions. It’s remarkable.”

- Rolando Francisco Jr, Functional Test Specialist. Idea Science
